

Sample Document

Page 1: Introduction

This is a basic PDF file created for practicing with LangChain's PyPDFLoader. PyPDFLoader reads a PDF and returns one Document object per page, each with `page_content` and metadata such as the source file path and page number.

You can load this file like so: `loader = PyPDFLoader('sample.pdf');` `pages = loader.load()`. The resulting 'pages' list will contain three Document objects, one for each page in this file.

Page 2: Sample Content

Artificial intelligence is the field of computer science focused on building systems that can perform tasks which normally require human intelligence, such as understanding language, recognizing patterns, and making decisions.

Large language models like Claude are trained on large amounts of text data and can be used for tasks such as summarization, question answering, and document retrieval, which is exactly what tools like LangChain help you build.

Fun fact: this page intentionally contains generic filler content so you have something to split, embed, and query in your practice pipeline.

Page 3: Conclusion

Once loaded, you can pass these Document objects into a text splitter such as `RecursiveCharacterTextSplitter`, then embed the resulting chunks and store them in a vector store for retrieval-augmented generation (RAG).

This concludes the sample document. Thanks for practicing with LangChain!
